

INSTRUCTIONS FOR USE

- **Equipment and Tool Preparation:**

Before use, check that the tool is clean, free of damage, and wear. Ensure the equipment it is attached to is in optimal working order. Securely attach the tool to the motor head.

- **Speed Setting:**

Adjust the rotation speed according to the manufacturer's specifications and the hardness of the material being worked. Excessive speed can generate heat, while too low a speed can reduce cutting efficiency.

- **Performing the Cut:**

Use firm, controlled movements, applying constant pressure but without forcing the tool. If the material requires it, maintain adequate lubrication or irrigation to prevent overheating and residue buildup.

- **Cleaning and Disposal:**

After each use, clean and, if reusable, sterilize the tool following appropriate protocols. If the tool is for single use, dispose of it safely and responsibly.

- **Maintenance:**

Regularly inspect the tool for signs of wear. If cutting performance decreases, it's time to replace it.
